Task 6: AI Usage Reflection

Final Project - Task 6 | Digital Loan Pre-Approval & Onboarding (MVP), Online Bank | Prepared by: [Your Name], Business Analyst | 09 November 2026

Part 1: AI Workflow Summary

Tools used

- **Claude (Anthropic):** main generative AI assistant for drafting questions, simulating stakeholder interviews, requirements, user stories, business rules, entity attributes, KPIs, test cases, plans, the executive brief and its Spanish translation.
- **Graphviz (DOT code) and Python / matplotlib:** to render AI-generated diagram code into the BPMN, component/data flow, entity model, stakeholder map and dashboard mock-up. This plays the same role as Mermaid in the lab instructions.
- **Microsoft Word:** final editing and formatting of the six deliverables.

Where AI was applied and how

Task	What AI produced	Prompt pattern used	How I reviewed / refined it
1 Discovery	10 role-based questions; 10 simulated Q&A; FR/NFR; MoSCoW; 10 user stories with Given/When/Then	Role + context + task + format, e.g., 'Act as a Compliance Officer... identify assumptions or missing controls'	Checked questions against the 5 interview objectives; logged gaps and conflicts (e.g., 3-minute vs 4-hour SLA); made NFRs measurable; flagged simulated answers as needing real validation
2 Process	BPMN steps and diagram code; journey map; component/data flow diagram code	'Generate a BPMN... every gateway must have labeled outgoing paths. Do not add steps that are not listed'	Rendered the code and checked every gateway branch (KYC, credit, review, incomplete loop); checked that all six required components appear and flows are labeled
3 Rules & data	10 business rules; 6 entities; 8 KPIs; dashboard layout	'Generate business rules with ID, trigger and IF/THEN logic with thresholds'	Checked rules cover all required categories; made thresholds consistent across tasks (680 / 600 / DTI 40%); ensured API failures never auto-decline
4 Quality	9 Gherkin test cases; UAT plan; deployment and rollback checklists; compliance brief	'Generate test cases based on these user stories and business rules...'	Mapped each test to a rule/story; added compliance tests (consent, audit immutability); marked regulatory content as an assumption to confirm
5 Communication	Executive brief; stakeholder map and RACI; Spanish brief; Jira epic/stories; Confluence outline	'Write a professional executive summary...'; 'Translate... keep technical terminology'	Kept the brief to one page with measurable outcomes; checked the translation keeps the same figures and terms; linked Jira stories to rules and tests

Where I relied on my own analysis

- Choosing the MVP boundaries and resolving conflicts between stakeholders (e.g., the 3-minute target applies only to automated decisions).
- Keeping IDs and thresholds consistent across all six documents, so requirements, rules, tests and Jira stories trace to each other.
- Deciding which risks matter most for a bank (consent before the credit pull, adverse-action notices, audit immutability).

[Add 1-2 specific examples of your own judgment or edits while reviewing these documents.]

Part 2: Responsible and Ethical AI Use

- **Privacy:** no real customer, employee or bank data was entered into the AI tool. All personas, scores and dashboard values are synthetic and labeled as illustrative.

- **Accuracy and compliance alignment:** regulatory points (FCRA, ECOA/Reg B, BSA/CIP, GLBA, E-SIGN) are kept at a high level and explicitly marked 'to be confirmed by Compliance and Legal'. Thresholds and the retention period are labeled as proposals.
- **AI supports, not replaces, judgment:** simulated interviews were used only to prepare for real ones; the document states that requirements must be validated with real stakeholders before baselining.
- **No blind copying:** every AI output was checked against the lab requirements and cross-checked with the other tasks before inclusion.
- **Bias and fairness:** decision rules use only credit-related factors (score, DTI, eligibility), with a recommendation to review reason codes for disparate impact under fair-lending rules.

Part 3: AI Limitations and Human Review

Limitation encountered	How it was handled
Generic answers: first drafts of interview answers and journey stages tend to be generic	Added a specific persona and project constraints to prompts; asked the AI to state assumptions and gaps explicitly
Domain/compliance depth: AI can state regulations confidently but cannot confirm what applies to this bank	Kept regulatory content high-level and flagged it for Compliance and Legal review
Inconsistency across outputs: separate prompts can produce different thresholds or IDs	Defined one set of thresholds and IDs and re-checked them across all six documents
Diagram accuracy: generated diagram code can miss branches or mislabel flows	Rendered each diagram and walked every path against the step list and validation checklist
Translation nuance	Kept industry terms (KYC, SLA, UAT, MVP) and explained 'soft pull'; recommend a native-speaker review before external use

Overall: generative AI made the first drafts much faster, but the quality came from structured prompts, cross-checking between tasks, and human review of anything with compliance or customer impact.
